

POINT OF SALE SYSTEM

R Y Z A M A E A L I C A W A Y

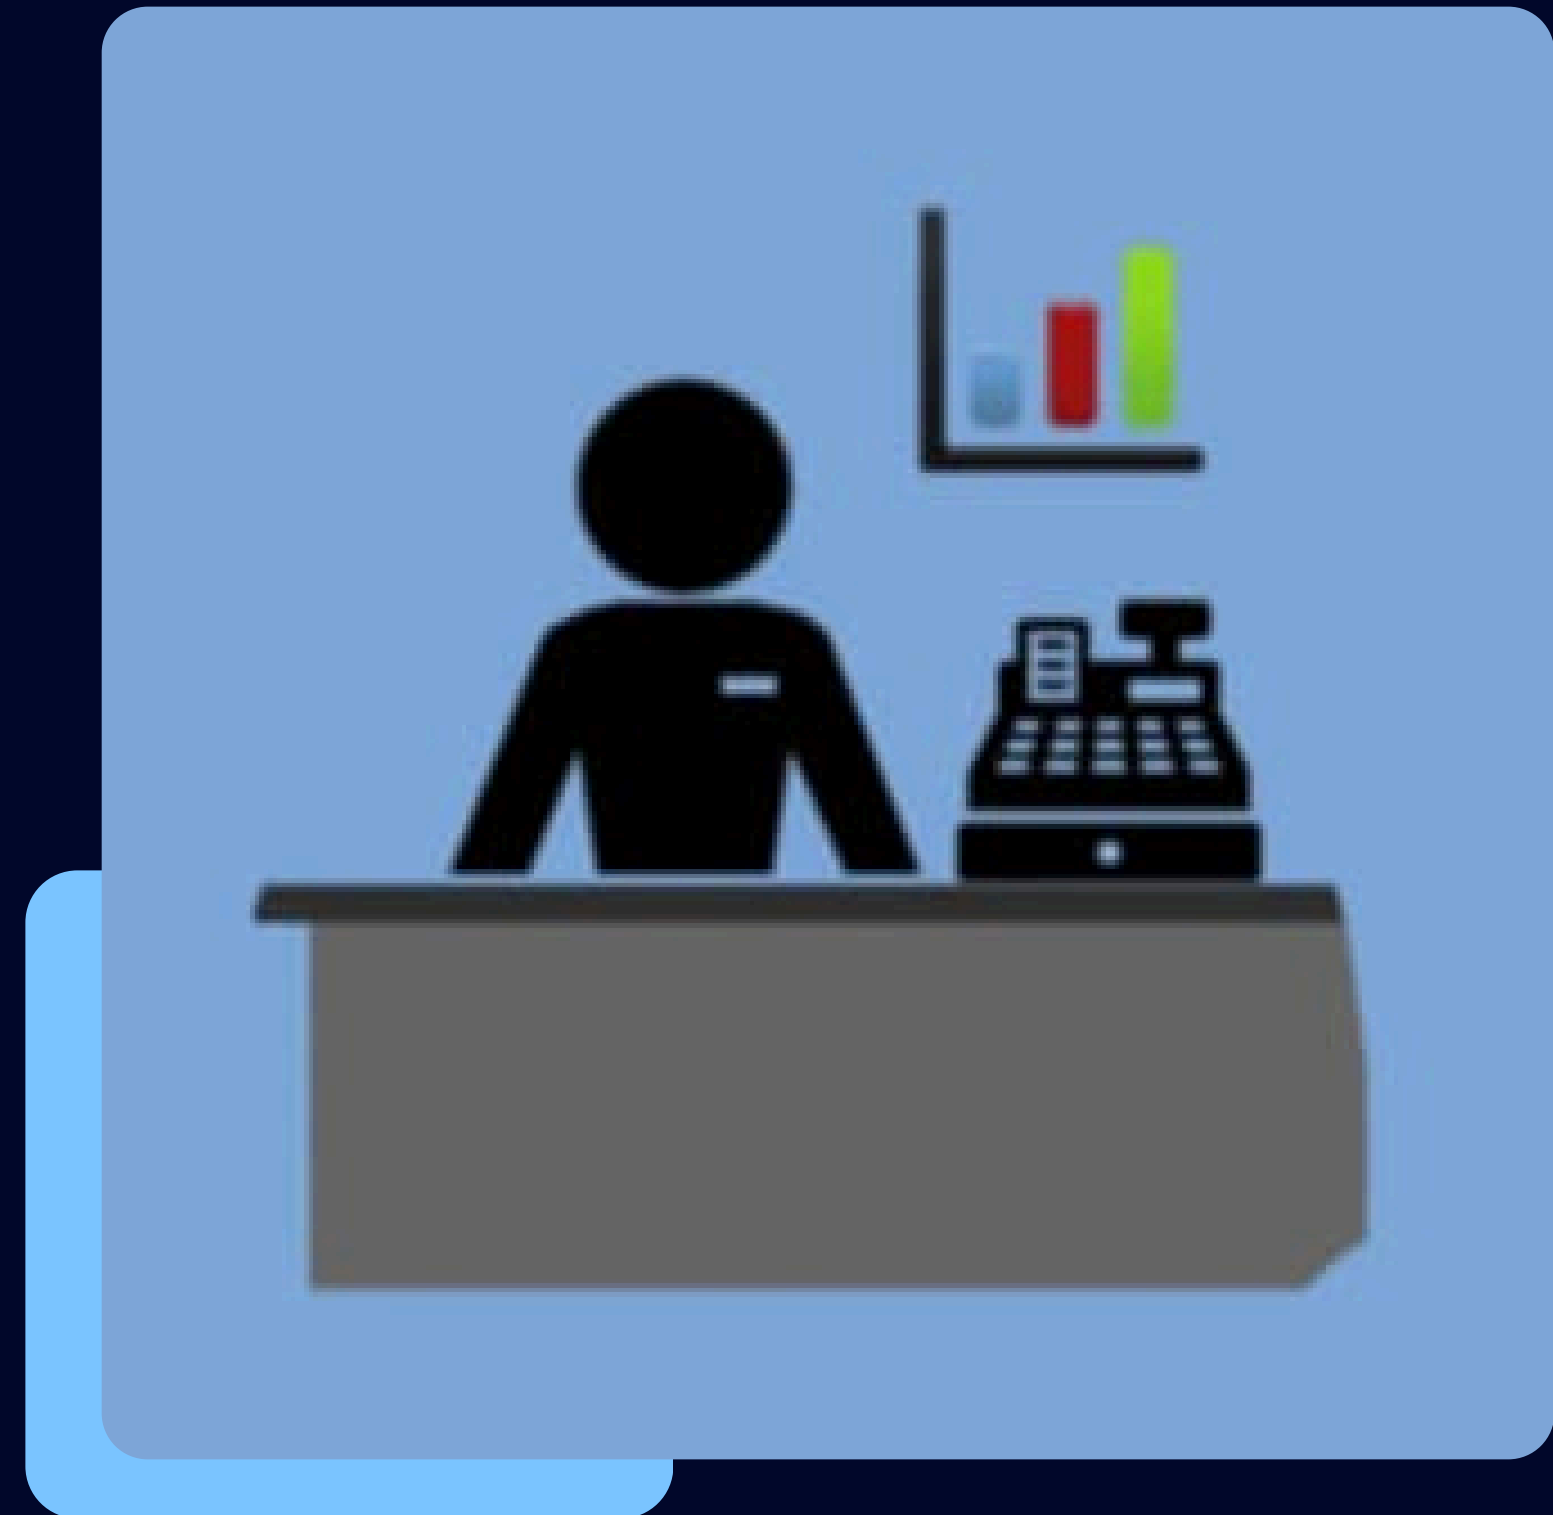

About POS

A desktop-based Point of Sale system built using C# (.NET Framework) with a user-friendly GUI. It allows users to manage transactions by adding, viewing, removing, and checking out items. All data is saved in a SQL Server database.

Key Functionalities

- 01 Add Item: Enter item name, price, and quantity.
- 02 Remove Item: Delete a selected item from the cart.
- 03 View Cart: Display added items with quantity and price.
- 04 Checkout: Finalize purchase and clear the cart.
- 05 Database Integration: Automatically stores cart data in SQL Server.
- 06 User Interface: Responsive GUI with list view and control buttons.
- 07 Quantity Control: Adjust item quantities using plus/minus buttons.

```
===== POINT OF SALE SYSTEM =====
```

```
1] Add Item  
2] Remove Item  
3] View Cart  
4] Checkout  
5] Exit
```

```
Enter Action: 1
```

```
== Add Item ==
```

```
Enter item name: sting
```

```
Enter price: 22
```

```
Enter quantity: 2
```

```
Item added! Press Enter to continue.
```

```
===== POINT OF SALE SYSTEM =====
```

```
1] Add Item  
2] Remove Item  
3] View Cart  
4] Checkout  
5] Exit
```

```
Enter Action: 3
```

```
== View Cart ==
```

```
. sting x2 - Php 22.00 each | Subtotal: Php 44.00
```

```
Total: Php 44.00
```

```
Press Enter to continue.
```

Console

The image displays a simple Point of Sale (POS) system. First, it shows how an item is added to the shopping cart, where you input the item's name, price, and quantity. After that, it demonstrates how you can view the cart's contents, including the items, their prices, and the total amount. The menu also indicates that the user can also remove an item from the cart by selecting option "2" and then choosing the number corresponding to the item they wish to remove. It's a straightforward process of adding, viewing, and removing items in the cart.

User Interface

01

This is the user interface of a simple Point of Sale (POS) system. At the top, the user can enter the item name and price, as well as adjust the quantity using the plus and minus buttons. Below that is a table that displays the list of items added along with their prices.

02

At the bottom, the total cost is automatically calculated and shown. There are also buttons for adding items, removing selected items, checking out, and exiting the application. The interface is designed to be straightforward and easy to use for managing basic sales transactions.

SQL Server 21

This is the database view from SQL Server Management Studio showing the Cart table of my POS system. Every time I add an item using the GUI, the item name, price, and quantity are automatically saved here. As shown, items like "coke", "piattos", and "fudgee bar" were added from the GUI and are now stored in the database with their details. This ensures that all sales data from the interface are properly recorded in the backend.

```
SQLQuery1.sql... \ryzam (69))  
1  SELECT TOP (1000) [Id]  
2      , [ItemName]  
3      , [ItemPrice]  
4      , [Quantity]  
5  FROM [DB_POS].[dbo].[Cart]  
6
```

100 % No issues found

Results Messages

	Id	ItemName	ItemPrice	Quantity
1	55	coke	20	2
2	56	piattos	18	2
3	57	fudgee bar	10	5

01

This is the API documentation of my POS system shown using Swagger. It displays the different actions that the system can perform on the Cart data through HTTP requests. The GET /api/Cart is used to retrieve all the items from the cart. The POST /api/Cart is used when a new item is added from the GUI, so it gets saved into the database. The DELETE /api/Cart/{id} removes a specific item based on its ID, and the PUT /api/Cart/{id} is used to update the details of an existing item. This API makes it possible for the POS interface and the database to communicate smoothly.
